

Email Filtering Solution

Cygnit is proud to provide a powerful and comprehensive email security service that accurately stops spam, viruses, fraud, and other email borne nuisances before they reach your network. Our intuitive administrative and user interfaces allow organisations to easily achieve their email security goals, without the burden of customizing a complex solution.

Instant Deployment

Our services require no hardware to buy and no software to install. With a simple change of your domain(s) MX records, your mail is routed through our servers, filtered, and the good messages are then passed on to your network. The entire filtering process typically takes less than a second.

Collaborative Anti-Spam

Multiple intelligent filtering techniques interact and analyze each message to achieve 98% capture rates. Anti-spam preferences can be set all the way down to the individual user, allowing maximum control.

Triple-Layer Anti-Virus

Each message is scanned for dangerous content by the award-winning Kaspersky Labs anti-virus engine, which is updated continually. Moreover, messages are scanned for dangerous content using advanced analysis technologies to detect the presence of viruses even before anti-virus signatures have been released.

Fully Integrated Anti-Phishing

Phishing techniques differ from traditional spam, and are difficult to catch with traditional spam filters. Cygnit utilizes anti-phishing technology specifically designed to catch fraudulent messages and prevent them from entering your network.

Anti-DHA/DoS

Find refuge from the storm of dark traffic by placing your organization under the umbrella of our Directory Harvest Attack and Denial of Service Attack protection features.

Disaster Recovery

Whenever your network is unavailable due to an outage, scheduled maintenance, or other event, Cygnit queues your mail for up to five days, promptly delivering to you when you come back online. Our standard disaster recovery services allow you to focus on restoring your network's availability, without worrying about lost email.

Bandwidth

Junk messages are not only a burden to sort through as they arrive in your inbox in-between legitimate correspondence but as the volume of junk messages grow, they continually eat away at your organization's resources such as bandwidth and storage. Moreover, sudden spikes in spam and viruses can severely impact or even shut down your mail servers. Cygnit solves this problem by pushing the battle against junk email entirely outside of your network. Our Pre-Network platform ensures only messages classified as genuine enter your infrastructure. The result is a significant savings in bandwidth, which can be observed through our reporting features.

Cost Reduction

No Upfront Investment – Cygnit operates on a simple monthly or annual subscription basis.

Nothing to Upgrade – Our upgrades are performed in-house, and never require you to purchase an upgrade license or new hardware.

No Maintenance - Our core focus is to provide industry-leading technology, to keep pace with evolving email threats. We are constantly refining and tuning our technology to provide the best possible performance to our customers. Our professionals keep pace with today's threats, so you don't have to.

System Requirements

SMTP mail server. Minimum 10 users.
